

C5 LICENSE PLATE LEDS

Using a #15 torx screwdriver, remove one of the factory license light housings and remove the bulb.

Plug in the new led strip aligning the red with brown and black with black. Turn on the lights and test. If it doesn't light, unplug and turn it 180 degrees and plug it in. Re-test.

Use bug and tar remover or equivalent to remove any wax or dirt in the mounting area. Use the supplied alcohol swab to do a final cleaning. Center the strip to the license plate, remove adhesive backing and apply strip to the rear fascia as in this photo.

Insert the mounting screw through the plastic loop holding the led wire then re-mount the factory light housing. You can remove the other light bulb from the housing you didn't use since the led lighting will look so much better!!
